
S20 Figure. Leading−edge overlap between the legs. Every pathway that fgsea calls at FDR < 0.05 in both training contrasts, in the same direction (71, each a main set after collapse in at least one leg). Bars split each pathway's leading−edge proteins into those shared by both legs and those in one leg only; lowest overlap at the bottom of each collection. Leading edges move with small ranking changes, so this describes and does not test. Data: leading_edge sheet of 07_leading_edge.xlsx.
