
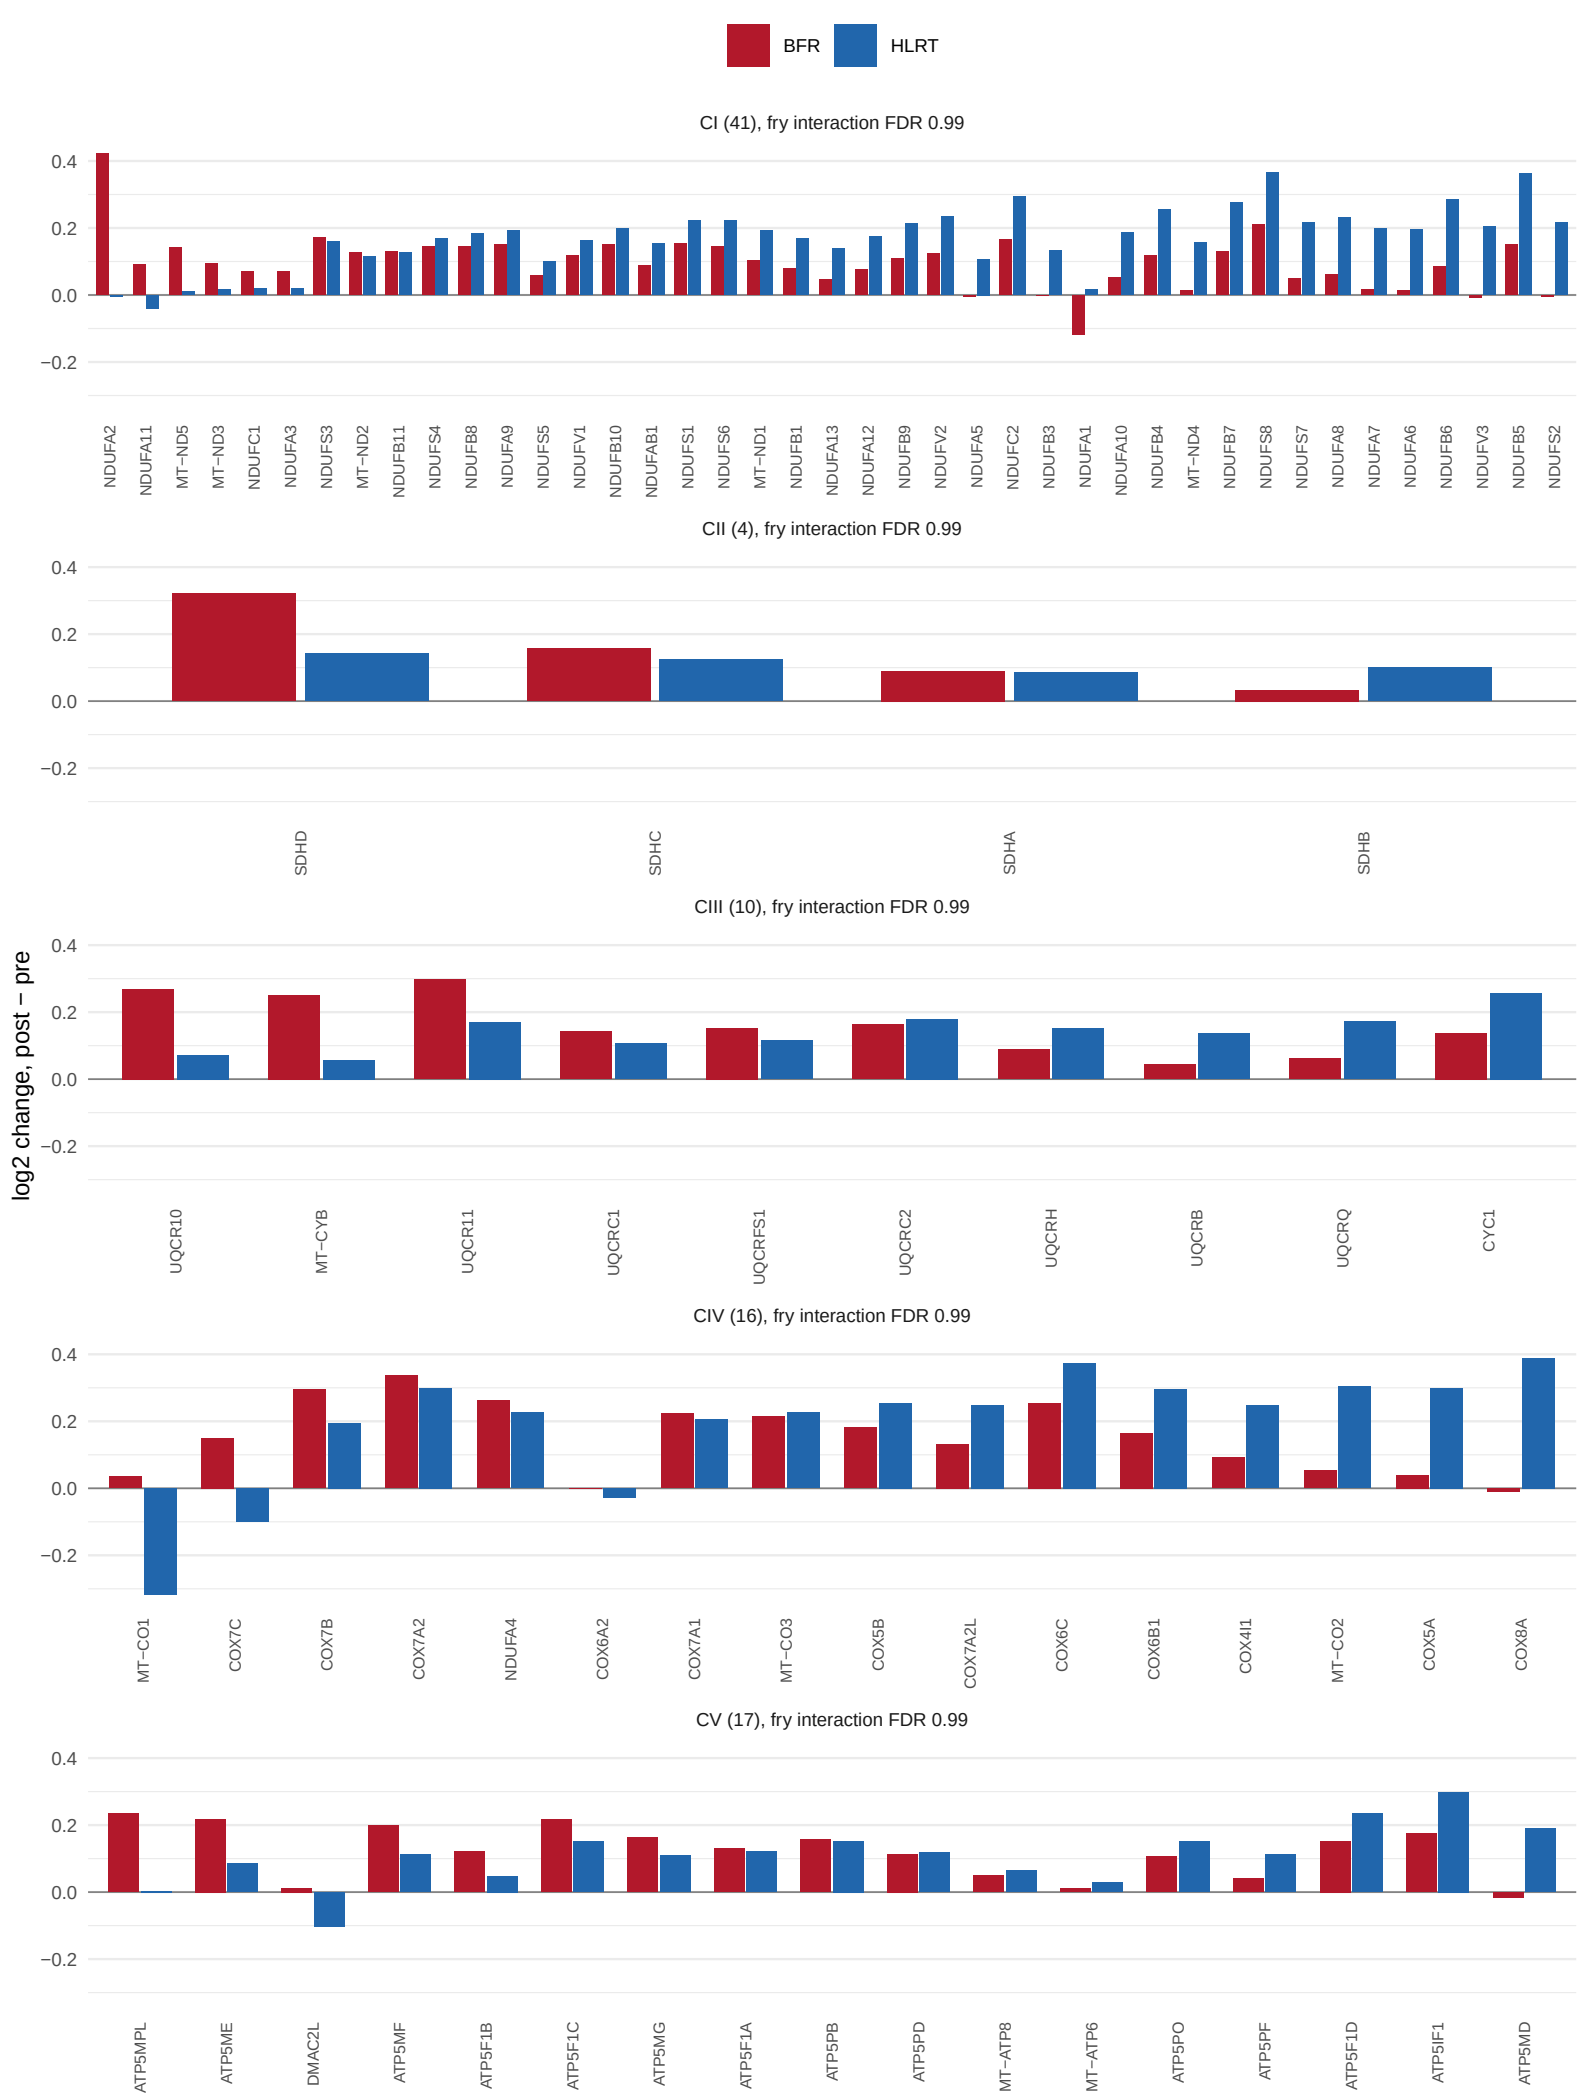
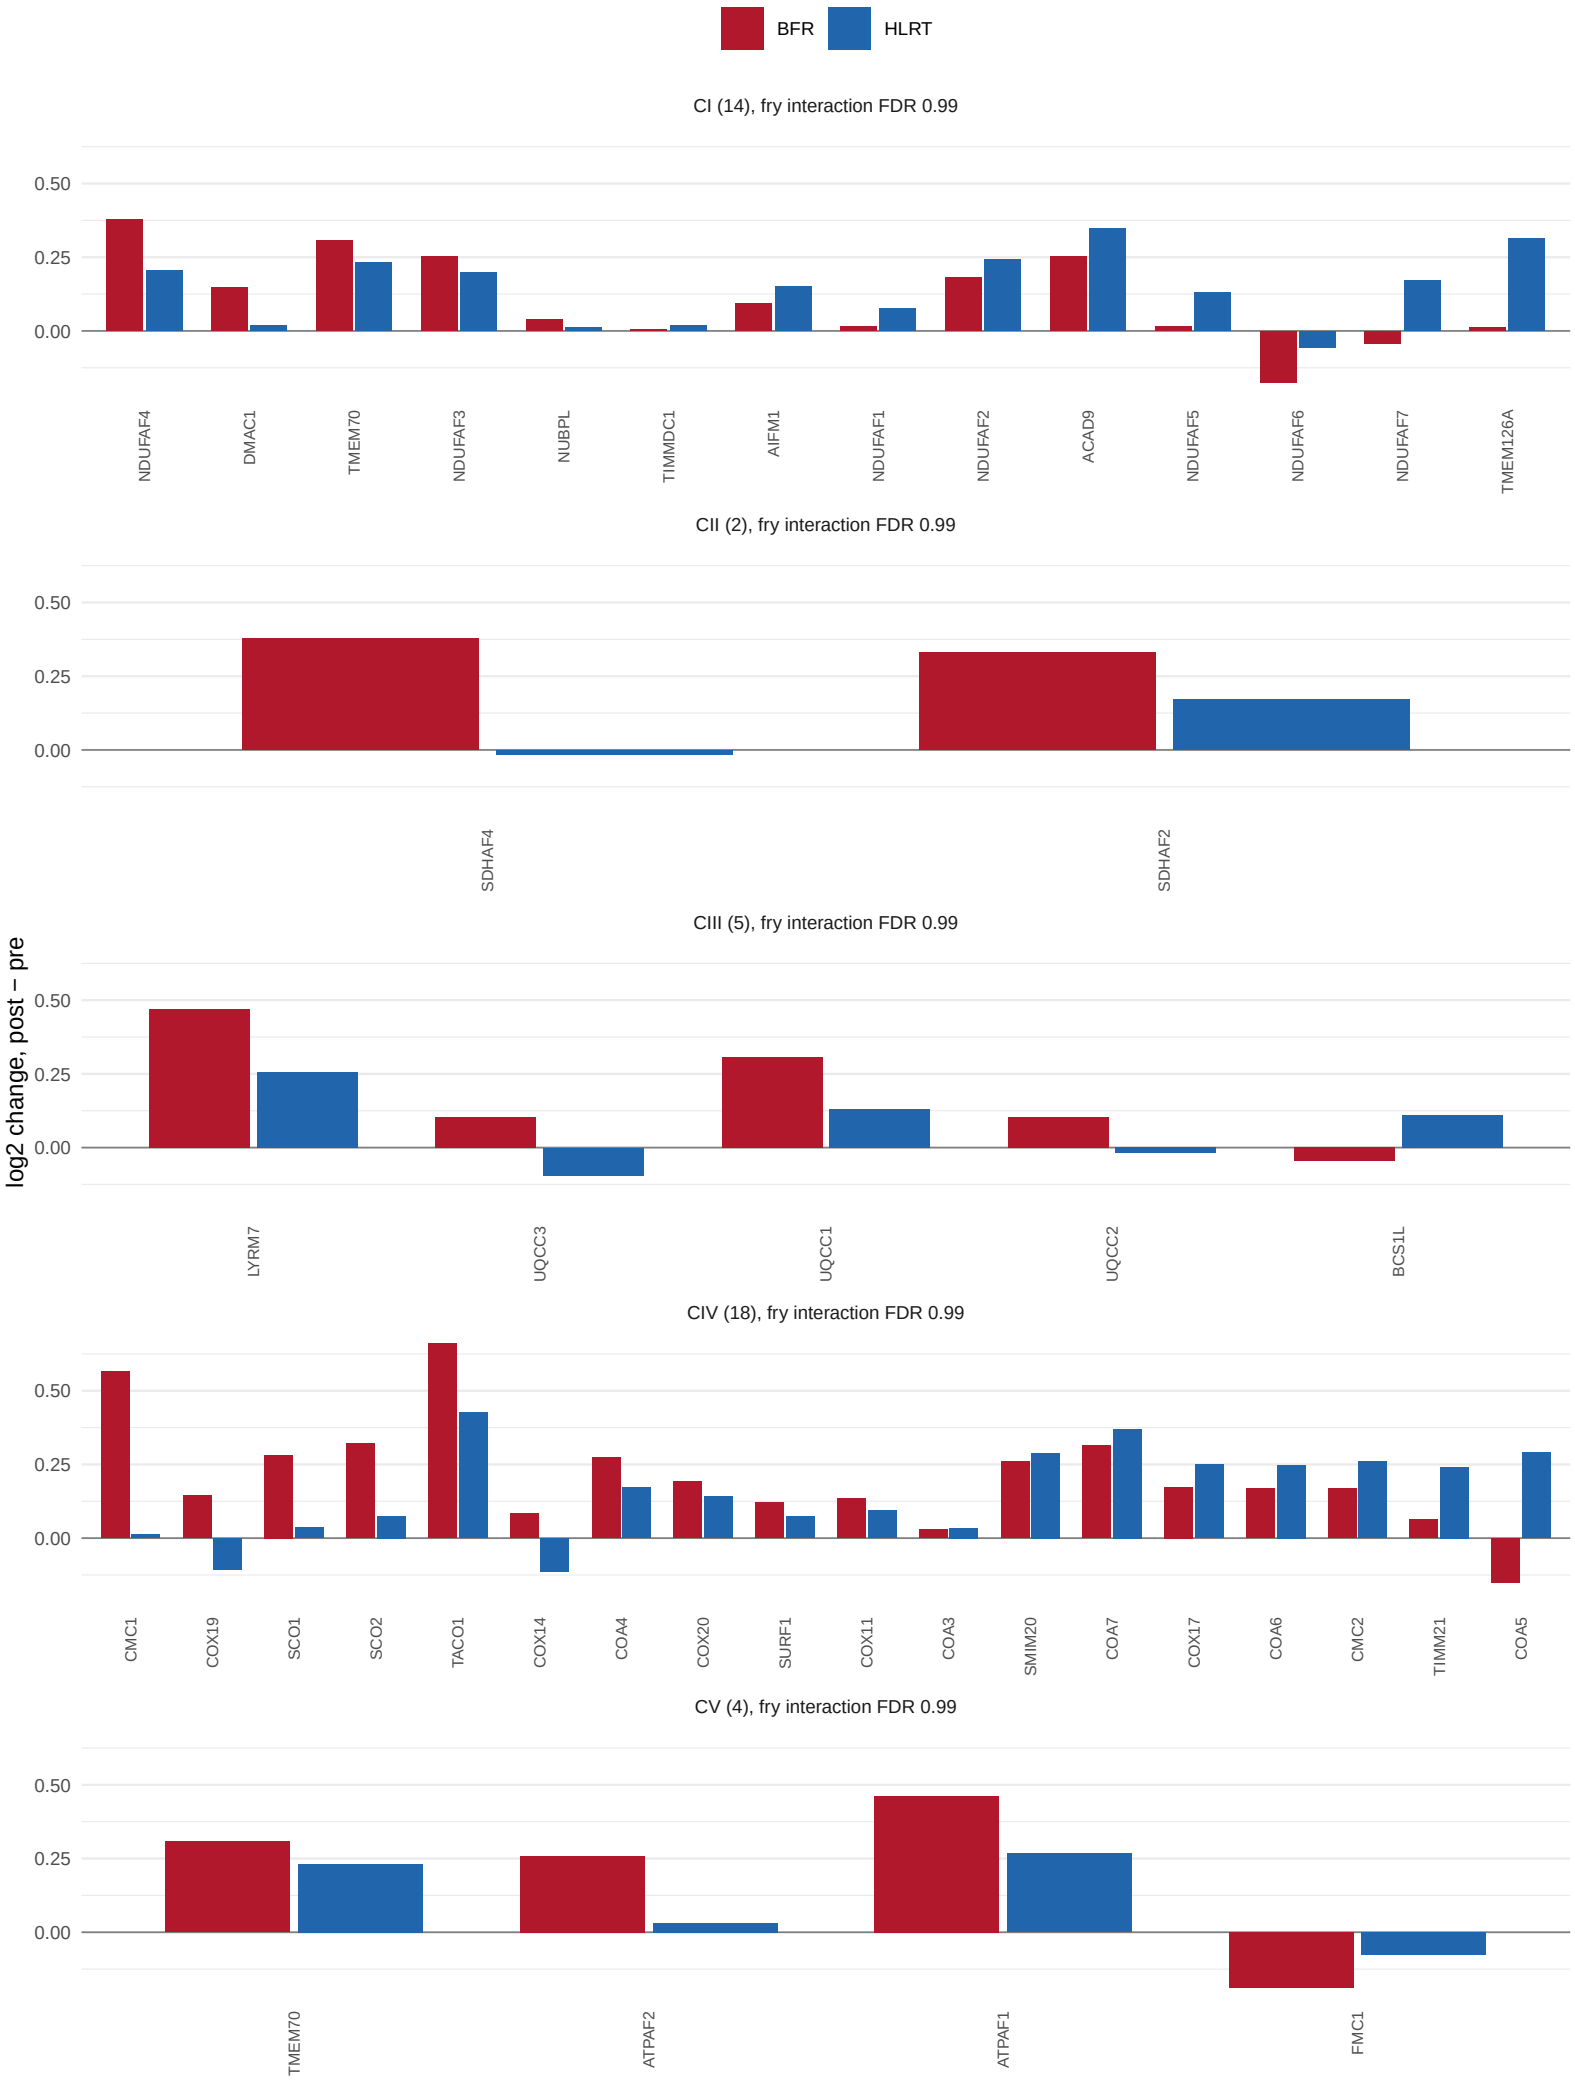
Complex subunits, summary by leg. Bars are the mean training change of each complex's measured subunits, with standard error; points are the subunits. The label is fry's interaction FDR on the complex, the set−level test of BFR against HLRT. Data: subunits sheet of 03_complex_subunits.xlsx.



Complex subunits by leg. Bars are each measured protein's training change in the BFR and the HLRT leg from the stage 02 fit, ordered within complex by BFR minus HLRT. Bars are not tested against each other: proteins of a complex are correlated, so the set−level test is fry in 02_test_mito, given in the panel title where it exists.
Data: subunits sheet of 03_complex_subunits.xlsx.



Complex assembly factors by leg. Bars are each measured protein's training change in the BFR and the HLRT leg from the stage 02 fit, ordered within complex by BFR minus HLRT. Bars are not tested against each other: proteins of a complex are correlated, so the set−level test is fry in 02_test_mito, given in the panel title where it exists.
